Data centre and AI's energy use

- Data centres, servers, and data transmission networks account for 1% to 1.5% of global electricity demand (2% in the EU, 4% in the US, 3% in China) (IEA, 2024)
- Between 7-10% of enterprise customers' total spend on compute infrastructure supports AI applications, with 3-4.5% used for training and 4-4.5% spent on inference (OECD, 2022)
- AI compute demands are growing faster than energy efficiency gains

What is AI?

An AI system is a machine-based system that, for explicit or implicit objectives **infers**, from the **input** it receives, how to generate **outputs** such as **predictions, content, recommendations, or decisions** that can influence physical or virtual environments. Different AI systems vary in their levels of autonomy and adaptiveness after deployment (OECD, 2023)

AI in building

Lange S, Frick V, Gossen M, Pohl J, Rohde F and Santarius T (2023) The induction effect: why the rebound effect is only half the story of technology's failure to achieve sustainability. *Front. Sustain.* 4:1178089.

BOX 2 Our studies on smart homes.

We conducted an interdisciplinary smart home study, which integrated concepts and methods from the fields of environmental assessment, environmental psychology, sociology, and science and technology studies. Our empirical insights are based on a quantitative survey with smart home owners in Germany with a smart heating system ($N = 375$), 12 user interviews, and a life cycle assessment that accounted for differences in user behavior. In addition, we conducted a twitter data analysis and a document analysis (Frick and Nguyen, 2021; Pohl et al., 2021; Rohde and Santarius, 2023).

Major findings are that the energy consumption due to the production and use of smart heating would necessitate at least a 6% reduction in energy consumption in heating in order for it to be environmentally beneficial. But smart home households purchase and use additional smart devices so that the reduction in energy consumption from heating would have to be even bigger. The quantitative survey shows that aspects such as safety, making everyday life easier, practical operation, convenience and financial savings are important motives for using smart home systems (Frick and Nguyen, 2021), which is one explanation for the large number of smart home devices that do not aim to reduce energy demand but to increase controllability and comfort (Strengers et al., 2020; Quitzow and Rohde, 2021). The findings show that four smart home user groups can be identified: enthusiasts, pragmatists, energy savers, and skeptics (Frick and Nguyen, 2021). Through a combination of quantitative network analysis and qualitative content analysis, we were able to reveal five discourse coalitions that form around certain storylines, namely "Threat", "Hackable", "Useless", "Fixable", and "Opportunity". It became evident that the most influential actors in the German online discourse were taking a critical stance toward the smart home (Rohde et al., under review).

Google

Google's emissions climb nearly 50% in five years due to AI energy demand

Tech giant's goal of reducing climate footprint at risk as it grows increasingly reliant on energy-hungry data centres

Google's goal of reducing its climate footprint is in jeopardy as it relies on more and more energy-hungry data centres to power its new **artificial intelligence** products. The tech giant revealed Tuesday that its greenhouse gas emissions have climbed 48% over the past five years.

Singapore lifts data center moratorium - but sets conditions

Minister for Trade and Industry says the country will be "more selective" in future

January 12, 2022 By: [Peter Judge](#)  [Have your say](#)

Singapore appears to have lifted its [moratorium on new data center projects](#), according to a statement by the Trade and Industry Minister this week - but new data centers will have to meet certain conditions.

Data centers contribute to Singapore's growth, but must be sustainable, said Minister Gan Kim Yong, in a written answer to Parliament on Tuesday, Jan 11. The country has paused new data center development since 2019, but this will now resume, though the government will impose measures to make them more efficient, he said.

National Green Algorithms Program

The National Green Algorithms Program will promote the development of green algorithms to maximize energy efficiency and reduce the environmental impact of artificial intelligence models.

The program will include specific investments in the context of the calls for proposals forming part of the ENIA and in addition a series of market-driven actions in support of sustainable and environmentally responsible artificial intelligence.

Policy Responses – UK AI Energy Council

Clean and renewable energy solutions are needed to power the increasing energy demands of AI. To identify potential solutions, the Science and Technology Secretary of State and the Energy Secretary will co-chair a new AI Energy Council formed of industry leaders from the energy and AI sectors. The Energy Council will provide expert insight on **the energy needs of AI**, opportunities to **accelerate investment in the development of renewable and innovative energy solutions**, including Small Modular Reactors (SMRs) and the **role of AI in a modern, efficient and sustainable energy system**
